

If you are computer literate or have done this kind of update before, please pay and download the Speed Camera update from www.pocketgpsworld.com to your desktop and copy all files to SafNav device's MMC, Navigator, Data, europe_ta directory. Otherwise, please follow the simplified instructions below.

Please follow the steps below to download and install the Navigator speed camera data update:

If you have a Microsoft Vista operating system, you can not install the updates as the *ActiveSync* programme does not work with Vista.

If you do not have *ActiveSync*, you may download it **free** of charge from Microsoft Download Centre, by double clicking the following link as this is essential for the update.

Step 1:

- Please go to website: www.pocketgpsworld.com
- Select Navigation Master, pay and download the speed camera data.
- Once downloaded, please double click on this **folder**. You may have to extract the files from this zip folder. Click on "**extract to**" icon on the toolbar.
- A new window will appear. Please select **Desktop** from the list on the right hand side and click on **OK**. This will unzip the folder on your desktop.
- Please minimise screen.

Step 2:

- Switch on your navigation device and key in your PIN number in order to open the device. You should see the **menu screen** on the device. Please do not open Navigation or A-Z.
- We have supplied you with a USB cable which is in the box. USB cables can only be inserted in one way and it is vital that you insert the cable correctly- without force.
- The large USB connector goes into your PC. The small connector, which has an **arrow** on the black and metal side, should be **face down** with the **black** side **facing up**.
- Once the cable and device are connected the *ActiveSync* will automatically connect and you will hear a **sound**.
- The *ActiveSync* programme will open a window with two options: **YES & NO**. Select **NO**.
- Select **NEXT** and then **minimise** this window.

Step 3:

- Click on the **My Computer** icon, which is either located on your **desktop** or **Start-up menu options**.
- Once selected, you will see a **Mobile device** icon. Double click on this and you should be shown what is currently on your Safnav device.
- Double click the **MMC card** folder, which will then bring up the contents of the MMC card.
- Double click the **Navigator** folder.
- Double click the **Data** folder.
- Double click the **europa_ta** folder and then **minimise** the screen.
- Please now go to the **Speed camera data** which you had **previously unzipped** in **Step 1** and click to **maximise** it.
- Once this folder is open, locate the **toolbar** at the top, click **edit** from the dropdown menu and click on **select all**. This will automatically highlight the contents of this folder.
- Click again on **edit** and select **copy** from the drop down menu. You then may **close** this folder.
- Re-open the **europa_ta** folder, select **edit** from the dropdown menu. Click on **paste**.
- The update will now begin transferring onto the MMC card Navigator folder (europa_ta).
- There will be a **warning window** asking if you would like to copy all files, click **YES to all**.
- The update should take less than 1 minute to complete; once the update window **disappears** the device will have been successfully updated.
- Please close all windows and disconnect the cables carefully as your update is now **complete**.
